as climate change continues to accelerate extreme weather events have created unprecedented variability in energy demand and consumption overloading existing infrastructure and causing large scale system breakdowns fundamentally these adverse events are driven by the supply demand mismatch within energy markets utility firms face fluctuating demand that cannot be precisely estimated and economically viable storage capabilities remain scarce despite the crucial role of weather related consumption patterns and the expected increase in the frequency and magnitude of weather anomalies caused by climate change little is known about how thermostats are used this dissertation analyzes the impact of weather on optimal household behavior and contrasts real world behavior with theoretically optimal decisions this dissertation also asks important policy questions around using price to incentivize households to reduce consumption chapter 2 develops an analytical model to establish what optimal thermostat control entails when considering the impact of weather on consumption a novel component of this chapter is the incorporation of rational inattention into the decision making process this concept posits that decision makers are not necessarily fully informed and rational agents but instead pay a cost to acquire and analyze information before taking action this cost of information processing allows for a natural approach to evaluating the theoretical effectiveness of technology solutions such as smart thermostats using a continuous time model for utility and energy consumption we characterize a household s optimal control policy by reducing a complex time

dependent problem to a static optimization problem chapter 3 is an empirical study of household smart thermostat usage the study examines how households make decisions about their thermostats in practice of particular interest is the impact of weather on household decision making and how this real world behavior differs from the optimal behavior discussed in chapter 2 to that end we empirically analyze a novel data set provided by ecobee inc this data set sheds light on the distinct nature of long term decisions represented by the system mode and short term decisions represented by the numeric setpoints in our study on long term behavior we model household movement between modes as a markov process with the transition probabilities arising from a multinomial logit model underpinning the logit model is a dynamic linear model which captures reactions to both seasonal trends and unanticipated temperature shocks a key insight is that household responses to the weather can be classified into one of three archetypes based on the frequency with which they use the auto mode when examining short term behavior we focus on the setpoints chosen and how they are adjusted over time we model the direction of these changes using a multinomial logit that captures time dependent temperature effects while controlling for preferences and anchoring behavior short term behavior can be categorized along two dimensions 1 how many pre programmed schedules a household uses and 2 how frequently a household overrides the pre programmed setpoint using these models we conduct a set of simulation studies to investigate the impact of climate change on energy consumption and find that cooling requirements in 2050 could be 70 higher than 2019 we also establish a clear link between consumption and thermostat behavior users that automate their long term decisions consume more than those that do not while households that rely on the thermostat only in the short term consume less chapter 4 considers the implications of the findings from chapters 2 and 3 on dynamic pricing for energy specifically we examine the burden that time of use tou pricing in ontario has on households whose occupancy pattern does not conform to the traditional 9 5 schedule by accounting for strategic behavior we are able to get a better understanding of the impact of tou pricing on these households we also consider how shiftable tasks such as doing laundry are impacted by occupancy schedules and tou pricing this chapter highlights the trade off between fairness equity and efficiency in pricing life s necessities in summary this dissertation studies thermostat behavior and the impact of weather on a household s decision making process and how these findings impact the design and implementation of pricing programs
